S&W Seed Co

(SANW-NASDAQ)

SANW: Second quarter revenue and cost of goods were spot on our estimates. Strategic changes are leading to improved gross margins.

The changes in strategy towards a customer centric model with emphasis on integrating biotechnology into its seed portfolio should lead to improved margins on a growing sales base.

OUTLOOK

S&W Seed is the world's largest supplier of alfalfa seeds following its acquisitions over the past few years and has added other forage crops to the portfolio. Potential earnings leverage include the introduction of Round-Up Ready alfalfa seeds and new non-GMO herbicide resistance varieties, the expansion of the marketing of dormant varieties into a wider geographical area in the USA and the production of stevia plants and seeds based on the company's ongoing research. The replacement of commodity seeds by proprietary varieties is an ongoing market strategy. The company has several patents for stevia plants.

RECENT EVENTS

S&W Seed reported its second quarter results and held a conference call on Feb. 08, 2018.

Revenue was \$21 million, in line with our estimate of \$21 million. Cost of revenue was \$16 million, as was our estimate. Operating income of \$0.5 million was slightly higher than our estimate of \$0.4 million. Sales to Pioneer/ Du Pont were \$15.3 million. Full year 2018 revenue should include about \$2 million of sorghum and sunflower revenue, double that produced in fiscal 2017. This should double again in 2019 with significant gains in 2020.

The N. American alfalfa crop yield was above average and the company had increased acres under production. As a result 2Q seed inventory was higher than expected. Seed does not perish so less acres will be needed over the next year.

On the call the company outlined its new strategy. It plans to move closer to the customer and emphasize trait differentiation in all four of its major crop areas. Building an integrated biotechnology based portfolio to meet the needs of the customer is the prime directive.

Australia offers the quickest avenue to meet its more immediate goals. S&W Seed already has a stable presence with customer awareness. It is a market where the company can develop and sell new varieties of sorghum and sunflower crops, as well as expanding in alfalfa.

Stevia will become more of a focus in the U.S.A. Currently stevia is harvested by hand in Asia which is not practical in countries with high labour costs. The near term objective is to introduce a stevia plant that can be harvested by machines currently in use for other crops. Since the flavor profile is one of the most important factors in its adoption S&W will be doing research using the most advanced analytical instruments to determine what trace molecules impact flavor.

Customers in N. America want a dependable supplier of stevia with consistent known levels of glycosides.

Revenue guidance for the 3Q18 was \$19 to \$20 million and for the full year revenue will probably be at the lower end of the guidance of \$75 million. This implies a 4Q18 level of close to \$24 million, a significant increase from 4Q17 levels.

The company issued a press release that the previously announced rights offering will commence on Nov. 29, 2017 to stockholders of record as of 5:00 pm Nov. 22, 2017. We had adjusted for this offering by increasing the shares outstanding prior to our report dated Nov. 09, 2017 so no further adjustment is required.

S&W Seed announced its first quarter results and held a conference call on Thursday November 09, 2017.

Revenue was better than expected at \$10.7 million versus our expectations of \$10.0 million. Gross margins improved from year ago levels and operating expenses were only slightly above last year's quarter. The net impact was that operating loss was less than we had expected.

Adjusted EBITDA was essentially unchanged from year ago levels, a negative \$0.967 this year and a negative \$0.971 last year. S&W Seed still expects adjusted EBITDA of between \$4.0 and \$5.5 million for the year. The revenue target range remains at \$75 to \$80 million.

The Central California alfalfa crop was harvested during the first quarter so, as expected, both inventory and accounts payable increased. Based on the dollar value of inventory, the highest for many years, the crop was a good one.

Both sunflower and sorghum are moving towards full scale production. Seed sales have started and seed is being planted for seed production and trials.

Senior management stated that stevia has moved to the front burner. A three year collaboration agreement with a major company to develop stevia plants with specific traits (possibly one of the varieties that have been patented) is under way.

Revenue by Country:	2013A	2014A	1Q15	2Q15	3Q15	4Q15	1Q16	2Q16	3Q16	4Q16	1Q17	2Q17	3Q17	4Q17	1Q18

The company filed its 10Q at the same time as the 8K was filed so we have the geographical breakdown of revenue. Libya was back in the market as was Mexico. Australia was flat with a year ago, which was a good effort since a significant part of Australian sales end up in Saudi Arabia. The US did better than last year, possibly due to late buying from the 4Q17.

As we expected the alfalfa products derived from the research collaboration between S&W Seed and Calyxt have been designated as non-regulated by USDA. That means that, subject to any other regulation, they may be sold in any country.

The fourth quarter and year end results were announced after the close of the market on Sept. 14, 2017.

Revenue was slightly better than our estimate but the impact of a substantial decline in sales to Saudi Arabia and a small drop in Pioneer related sales had a greater effect on margins than we had anticipated. Operating expenses were also higher than expected due, in part, to severance expenses to Mr. Grewal.

The company decided to adjust, for tax purposes only, its deferred tax account and a tax adjustment of \$9.6 million caused the GAAP tax expense to increase to \$8.2 million whereas we had expected a tax credit in the 4Q17. We have decided to use the adjustment for deferred taxes as an extra item and add back the \$9.6 million. This reduces the per share loss to \$0.08.

The company has announced that it expects the problems in Saudi Arabia will continue into fiscal 2018 but some of the loss will be made up by increased sales in the Sudan.

Another stevia patent and the sweetener market:

S&W Seed has received another plant patent that covers a new variety of stevia plants, SW 129. This variety (see table on page 7) is aimed at the commercial production market. The company reiterated its commitment to stevia as a future market for S&W Seed.

A recent article in the trade magazine Beverage Industry (Sept. 11, 2017) outlined the changes in the sweetener market due to a number of factors. Sugar consumption was one of the major factors discussed.

The implementation of soda taxes to reduce sugar intake and the new FDA labels on Nutrition Facts are driving beverage and food companies into looking for more sweeteners and different formulations as sugar substitutes. The labeling requires the listing of the amount of added sugar in foods and beverages.

The focus is on healthy eating stated Matt Drew of Archer Daniels Midland (ADM). Emphasizing the speed at which beverage makers, such as PepsiCo (PEP); The Coca-Cola Co. (KO) and The Coca-Cola Bottling Co. (COKE) and food companies such as Cargill, the CEO of Steviva Ingredients noted that the company has seen a ten-fold spike in requests for reformulation from beverage companies. When sugar content is reduced other aspects of a formulation must also

change, noted Ihab Bishay, senior director of R&D at Ajinomoto North America Inc.. Often when reducing sugar in beverages several sweeteners may be needed to round out the profile.

The director of commercial sales at Pyure Brands outlined that the needs of the consumer varies according to the product and choosing the right sweetener profile is essential, whereas Faith Son, head of marketing at PureCircle, noted that there are other factors should be included, such as mouthfeel and the origin of the product. Consistency and stability of supply and cost effectiveness are important.

However, as the vice president of platform management and sweeteners at Tate & Lyle said, taste remains the dominant driver. Stevia is the second, after honey, best product for taste and health.

Stevia continues to gain traction with consumers, noted Afrouz Naeini, senior marketing manager of sweetness and beverage at Ingredion Inc., highlighting the innovation taking place in stevia sweetening solutions

These factors are where S&W Seed can meet the needs of both stevia growers and beverage formulators with seeds of superior characteristics that are reproducible in the field.

S&W Seed has revised its guidance for the 2017 fiscal year, ending June 2017. The revised fourth quarter numbers were below our estimates, which were below published estimates and street guidance.

The problems are the strict water controls proposed in Saudi Arabia. Orders for alfalfa seed have dropped precipitously to essentially zero. As far as we can tell there have been no offsetting orders from adjacent countries.

We are now assuming zero revenue in 4Q17 from distributors in Saudi Arabia, flat sales year over year in the U.S.A. and a modest increase in the rest of the world. Total revenue is now assumed to be \$17 million.

Gross margins are assumed to be down from 3Q17 levels but very slightly above year ago levels. The net impact is a loss of \$1.3 million pretax. For the year it is possible that the negative tax rate could reduce the 4Q17 loss to \$0.04 a share.

S&W Seed has raised close to \$10 million from the sale of stock, mainly to existing shareholders. The additional 2.69 million shares, priced at \$4.00 a share, will lower the loss per share in early 2018.

S&W Seed has appointed Mark W. Wong, currently a member of the Board of Directors, has been named as CEO effective immediately (June 20, 2017) replacing Mark Grewal who will become a consultant to the company.

Mr. Wong has many years of ownership and experience in industrial biotechnology, seed genetics and plant genetics as outlined in the press release.

During Mr. Grewal's stewardship SANW has entered into a number of agreements with seed genetic companies. These include Roundup Ready alfalfa, currently in production and agreements with Generic Genetics, Genuity, Calyxt and Bioceres S.A.

The next step is to develop products and move them to market and add to the organic growth of S&W Seed. Mr. Wong's background makes him highly qualified for the next stage in the company's development.

On May 30, 2017 S&W Seed announced that it had entered into a distribution agreement with Wilbur-Ellis Agribusiness.

Founded in 1921 Wilbur-Ellis is a major distribution company, marketing agricultural products, animal feed and specialty chemicals through more than 160 retail branch locations across the U.S.. Total revenue exceeds \$3 billion with the agricultural business accounting for over 67% of revenue.

The agreement is for S&W Seed to supply Wilbur-Ellis with its full range of alfalfa seed varieties, both dormant and non-dormant and including S&W's recently announced Roundup Ready varieties.

S&W will also supply seeds for Wilbur-Ellis' private label brand, Integra.

This agreement will expand S&W's marketing reach across more of N. America than it currently does and could be a major source of organic growth in coming years.

Third quarter results were reported on May 10, 2017. Due to the impact of proposed regulation on water consumption by large companies revenue from Saudi Arabia declined from \$3.4 million last year to almost nothing in the third quarter.

Gross margins increased, partially due to the fact that sales in the U.S.A. were a larger proportion of revenue than last year and these sales carry a better gross margin.

Operating expenses were slightly below our estimate as was the tax rate. Operating margins (before non-operating items) were 7.47% as compared to our estimate of 7.46%. Excluding the change in derivative warrant liabilities of a \$1.01 million credit to income earnings on a fully diluted basis were \$0.02 a share as compared to our estimate of \$0.03.

S&W Seed changed its guidance to revenue in the range of \$82 to \$87 million and Adjusted EBITDA in the range of \$5.7 and \$7.1million. In our new model this equates to 4Q17 revenue of \$26 million and an EPS of \$0.04 a share.

During the conference call the CEO mentioned that there was a significant increase in interest in the Sudan and in Egypt in adding significant acreage and in buying seed and then exporting the alfalfa to Saudi Arabia. If S&W Seed can participate in this then orders would be placed in the 4Q17 for delivery in 1Q18 fiscal year.

The Australian crop has been impacted by cold weather and very heavy rain. It is estimated the yields could decline by as much as 50% from the average yield of the past few years. Growers will be buying inventory from prior years. This may increase prices next year unless there is a bumper crop in 2018.

The company expects to sell sorghum seed next fiscal year, its first harvest from April 2017 plantings.

S&W Seed and Generic Genetics have agreed to develop alfalfa seed varieties containing selected biotechnology characteristics. Generic Genetics is headed by Dr. David Stalker, a renowned expert in biotech trait development. As certain technologies come off patent over the next few years Generic Genetics and S&W will develop specific products for S&W Seed. Dr. Stalker has been involved in the introduction of transgenic traits in soybean, canola and cotton. We do not expect this collaboration to have any material impact on revenue within the next few years.

On April 25, 2017 the U.S. Patent and Trademark Office granted S&W Seed a plant patent on the company's stevia variety SW 107. This is the second stevia patent received by the company, following the patent received for SW 201 as announced on March 30, 2017.

In the tests announced previously SW 107 did well in leaf production, TSG concentration and Reb-A content across all of the geographical locations and under significantly different climatic conditions.

Stevia continues to be the fastest growing zero calorie sweetener currently available in the market and at this time there are no other stevia varieties in the market that can match the S&W varieties in total stevia glycoside [TSG] concentration.

S&W Seed has announced the introduction of a non-dormant alfalfa seed, SW9215RRS, that is resistant to the Roundup herbicide. This seed uses the Genuity technology.

This is a high yield, salt tolerant variety ideally suited to growing in alkaline soils in arid conditions as found in the Imperial Valley (where only non GMO varieties can be grown) and from Arizona through Texas.

Roundup Ready seed varieties sell for premium prices as compared to seed that are not resistant. Sales of this, and other glyphosate herbicides, can have a significant impact on gross margins.

On March 30, 2017 S&W Seed announced that the company has received its first stevia patent, patent number PP27815, for the unique stevia variety SW 201. Issued on March 28, 2017 the patent has a 20 year term.

At the same time the company filed for three other varieties, SW 227 for the leaf market and SW 107 and SW 129 for the commercial processing market.

SW 201 was designed for sale in the stevia leaf market and has an improved taste profile with little bitterness and aftertaste.

Compared to other SW varieties SW 201 is ideally suited to being grown in arid conditions with very high Reb A content, twice that of the control variety "Candy", when grown in Indio, CA and two and a half times "Candy" when grown in Yuma, AZ.

Now that S&W Seed has patent protection it can generate revenue for licensing, selling seed or selling leaf.

S&W Seed has announced that the American Society of Horticulture Science published a study on glycoside (sweetener) productivity of stevia.

This study examined the effects of location (four places) harvest strategy and cultivar (type) on dry leaf yield, steviol glycoside (chemicals) concentration and yield. We have used the data in the publication to show the impact of each variety studied on the production of Rebaudioside A (Reb A) the most commercially important of the sweeteners in the stevia leaf. The results are shown below.

Reb A Yield	Indio, CA	Yuma, AZ	Hanford, CA	Ontario, OR
kg/ha, Single harvest				
Varietal:				
1049	-	-	223.2	409.2
1090	352.1	171.9	323.2	329.5
1108	298.8	202.2	231.9	164.0
SW 107	354.6	376.1	282.2	460.2
SW 129	355.8	222.1	290.3	478.8
SW 201	406.2	427.7	-	413.6
Control*	203.5	170.9	99.5	135.0
[* Candy, Genesis Seed Ltd , Ashalin, Israel.]				

In most cases, although all sites were irrigated, the samples from the moist climate in Oregon contained higher levels of Reb A than samples grown in the arid conditions of the Palm desert in California or the Sonoran Desert in Arizona. However, certain varieties did better in arid conditions than in moist conditions.

With this data the farmer can select the best varietal for the local conditions. For example SW201 would be a good candidate for acidic loam soil as found in Indio and Yuma.

In all cases the production per acre of Reb A was enhanced by the breeding program of S&W Seed. Yield improvements by a factor of 300% of control plant production are a strong incentive to the farmer to buy seed from S&W Seed.

On March 02, 2017 the company announced that it has retired the remaining amount of the convertible debentures issued in 2014 that were partially used to acquire the DuPont Pioneer alfalfa seed operation.

Some of these debentures have been retired in each quarter as excess cash flow and lines of credit have been sufficient retire them. The combination of interest expense and amortization of debt discount charges have declined from over \$0.5 million a month to \$0.2 a month and is now down to zero.

Our forecasts had assumed that the expenses from the debentures would end this fiscal year and so we have not changed our estimates. Since the company has assumed a significant amount of short term debt under the current line of credit (\$22 million as of Dec. 31, 2016) we have not reduced the interest expense to zero. However, on a quarter to quarter basis 2018 fiscal year will show a significant improvement in non-operating expenses.

S&W Seed announced its second fiscal quarter financials on February 09, 2017 followed by a conference call.

Revenue was \$24.23 million (our estimate was \$22.0 million); cost of revenue \$19.01 million (est.: \$19.2); SG&A \$2.59 (est.: \$2.4); R&D \$0.75 (est.: \$0.75). Overall the operating financials were in line with our numbers.

Gross margins improved, as expected, from 16.7% to 21.6% due to improved cost control and a better product mix.

Other expense included the Change in derivative warrant liabilities. The warrants are "in the money" and under current accounting rules when the EPS is calculated using fully diluted shares the share equivalent calculation includes the converted warrants so the gain has to be excluded. This drops the EPS from \$0.065 to \$0.01.

S&W Seed announced it had signed a stevia R&D collaboration deal with a major consumer products company. Details are still confidential.

In Saudi Arabia, a major alfalfa seed buyer, buyers and distributors have cut back orders due to uncertainty about discussions on water use regulations. Last year Saudi purchased \$31.5 million in seed, \$17.5 in the 4Q16 alone. So far this year Saudi sales have been about \$5.2 million with the second quarter about \$2 as compared to \$4.3 million last year. There is no certainty that the discussions will allow over \$20 million of seed to be sold in the second half of the year. However, the cows still need to eat and other areas such as Libya, North Africa and the Sudan could take up the slack.

Management discussed the sorghum and sunflower business. They have targeted sales of about \$30 million a year, ramping up from \$7 million in fiscal 2019 and \$15 million in 2020. We have projected sales of \$2 million in fiscal 2017.

S&W Seed has started commercial production of one of its varieties of hybrid sunflower seeds developed by SV Genetics. Production will be in the Murrumbidgee Irrigation Area of New South Wales.

The projected customer base will be through distribution partners in Australia, South Africa, Brazil and Pakistan.

In our opinion the sunflower and sorghum business could generate significant revenue in fiscal 2019. Potential margins could be much higher than those currently reported.

The company has reported that it has added 45 new varieties to its alfalfa portfolio, none of which have been marketed by S&W Seed. These varieties include both dormant and non-dormant types and have been developed by S&W Seed, Pioneer and Seed Genetics. These offer pest and disease resistance as well as some varieties with the highest salt tolerance currently available.

Salt tolerance is important in many parts of the world, such as parts of the Imperial Valley in S. California, where the soil has been contaminated by many years of excessive fertilization which builds up the salt level. Other land that have naturally high levels of salt can grow certain crops but not alfalfa or other forage crops.

Pests and fungi can have a major impact of seed germination and the development of immature plants. Many of these are treated with expensive insecticides and fungicides but this carries the risk of migration into the food chain, and many are hazardous compounds that require special handling. A better solution is to develop plants that have a genetic resistance developed by selective breeding.

Another problem with long stemmed plants is that they don't all return to an upright position during harvesting. The stems become bent or twisted (known as lodging) and the plants bend over and flatten one another. This can cause loss of cut matter. Research at the U. of Wisconsin estimated that there was a loss in forage yield of 0.17 tons of dry matter per acre for each inch of stubble that is left behind. This translates to a loss of 1,000 lbs. of milk per acre per inch to the dairy farmer.

On Jan. 19, 2017 S&W Seed announced that it has started to scale up its sorghum operations to make hybrid seeds available for commercial sale. The company expects to mirror its sorghum (and, presumably its sunflower operations at a later date) to how it runs its alfalfa business. Based on its royalty-based licensing agreements with its 12 partners, in 9 countries, the partners are currently increasing production of both hybrid grain and hybrid forage seed production in order to satisfy a significant level of demand.

We would anticipate revenue from the agreements in fiscal 2018.

The recent rains in California have had a significant impact on the drought conditions, with the areas considered to be under a drought dropping to half of what they were. This, and the passing of the Water Infrastructure Improvements for the Nation bill which was passed by the US Senate in late 2016, should encourage farmers to plant more crops in California. Although S&W Seed's ability to grow and acquire seeds is not impacted by the water bill the improving climatic conditions should have a positive impact on demand for seeds.

The company has announced that it will move its corporate offices from Fresno, CA to just down the road to Hanford CA. This is expected to reduce expenses.

On Jan. 05, 2017 S&W Seed Co. announced it had received a stevia trademark for the brand name "Kandi Leaf" , following its earlier stevia trademark of "Stevia California". The company now has patents pending for various unique stevia varieties that can be marketed under these, and potentially other, trademarks.

Trademarks do not expire as long as they are being used, subject to renewal after 10 years.

S&W Seed now has four varieties of stevia, SW 107; SW 129; SW 201 and SW 227. These varieties have increased levels of the primary glycoside sweetener Reb. A and lower concentrations of less desirable, and often bitter tasting, compounds. The plants themselves are more vigorous than naturally occurring varieties leading to greater leaf mass per plant. They may flower at different times per year so they can be tailored to specific climates.

S&W Seed now has, in place, the essential means to offer the market a variety of products from intellectual property, access from seeds to glycoside depending on the desire of the customer. Once the US Patent Office has granted patents to S&W Seed we expect further moves to generate revenue and profits from Stevia.

There is no other company that can, at this time, offer such a wide range of products that will provide better tasting stevia at a lower cost to the global market.

S&W Seed announced its first fiscal 2017 quarter financial results after the close of the stock markets on November 10, 2017 followed by a conference call.

Revenue and operating income were in line with our projections. We had projected revenue of \$12.5 million, it came in at \$12.3 million. Gross margins declined slightly and increases in operating expenses were close to our estimates. Operating losses were close to our estimates, at \$2.03 million versus our estimate of a loss of \$2.09 million.

Other expenses, mainly non cash, were \$2.23 million, resulting in a pretax loss of \$4.32 million, the tax benefit of \$1.1 million reduced the net loss to \$3.2 million, or a loss of \$0.19 a share.

The first quarter was affected by a change in product mix. Close to 45% of sales were of lower margined non-proprietary seeds, partially due to a lack of inventory of premium products. During the rest of the year seeds from the Pioneer acquisition (in Q2) Australia (3Q and Q4) and S. California (Q4) will be available and these are higher yielding, more profitable, products. The company expects the mix to move sharply towards 90% proprietary seeds.

During the first quarter the company added two new distributors in the Pacific Northwest US that have a customer base that does not compete with current distributors. A distributor in the Middle East North Africa (MENA) region that has a very large customer also joined up in the quarter.

Overall it was a reasonably good quarter on an operating basis. The non-op expenses will decline in the rest of fiscal 2017 and fiscal 2018 as the convertible debt is paid off and the warrants mature.

The company reiterated its projection of \$100 million in revenue for this fiscal year. It expects to add to its inventory of proprietary seed so as to balance out revenue and demand in fiscal 2018, assuming yields are average or better.

The other crops, sunflower and sorghum, will have new genome varieties available in late 2018 and Stevia interest continues with an emphasis on capitalizing on new high yield varieties.

On Sept. 15, 2016 S&W Seed announced its fourth quarter and 2016 results, followed by a conference call. Revenue and gross margins were in line with our expectations (\$34.6A and 19.9% versus \$34.5 and 20%) but there were a number of non-reoccurring items in the operating expenses that had a negative impact. Adding back many of these items (but not the amortization of the debt discount) and adjusting the tax rate the net income (by our calculation) would have been \$0.9 million or \$0.06 a share.

Revenue for the largest sales areas (so the countries vary in each quarter and for the full year) is shown below. The impact of sales to Pioneer/Du Pont was significant. Mexico is a significant customer, possibly because the Imperial Valley abuts the Mexican border and is a significant agricultural producing area.

During the conference call the company stated the convertible debt was now down to \$5 million and the amortization of debt discount will end in 3Q17.

In 2016 SANW increased the acreage under contract by about 15%. Many contracts that resulted in significantly higher costs have been renegotiated, or have ended, and we expect higher gross margins in the second half of 2017 fiscal year. A good part of the new acres are in Australia, which has lower production costs than the crops grown in California.

The company expects to introduce Pound-Up Ready alfalfa into the marketplace later this fiscal year. It already sells the Pioneer version so the customer base is well established.

S&W Seed now has four stevia patent applications in progress. At least one of these high yield versions could receive approval late this calendar year or early next year and it is possible that S&S Seed may have products or license deals with 12 months.

The company has provided its guidance for fiscal 2017 revenue of \$100 million, an increase of 4.1%. Inventories are currently very low and will have to be rebuilt. However, given a 15% increase in net acres under contract we believe that \$100 million is too conservative and we are assuming it will be closer to \$103 million. Earnings comparisons are clouded due to the non reoccurring items in fiscal 2016 but higher earning and improving margins should push operating earning higher. Non operating expenses and a more normal tax rate could drive earnings too much higher levels in 2017 and beyond.

The company has announced it has signed a license agreement with a leading U.S.- based seed company for the production and marketing of a proprietary hybrid grain sorghum.

Sorghum is a major crop world-wide with the U.S. being the largest producer and China being the largest importer. The top five producing countries are the U.S.A. at 10,338 thousand metric tons, Mexico at 6,900 thousand, Nigeria 6,500 thousand and both India and the Sudan at 5,500 thousand metric tons. The U.S. has six times the productivity of Sudan which has the largest number of hectares under cultivation. Farmers have tended to increase acreage the year after high prices and reduce them when returns are low.

Year	Planted acres	Production	Yield.	Price	Price times
US data	Millions*	Million bushels	per harvested acre	average	Production
Crop year ending in August				\$ per bushel	Million US\$
2010	6.60	381.61	69.40	\$3.22	\$1,228.78
2011	5.37	345.46	71.90	\$5.02	\$1,734.21
2012	5.45	212.99	54.00	\$5.99	\$1,275.81
2013	6.26	247.74	49.60	\$6.33	\$1,568.19
2014	8.08	392.33	59.60	\$4.28	\$1,679.17
2015	7.14	432.58	67.60	\$4.03	\$1,743.30
2016	8.46	596.75	76.01	\$3.30	\$1,969.28
2017E	7.23	420.00	65.06	\$2.85 to \$3.45	\$1,386.00
* Grain sorghum is by far the largest portion at 90%					
USDA data and estimates					

Sorghum has three main sub types, grain sorghum, which is 90% of the acres harvested, forage types and sweet sorghum. Grain sorghum has a high starch content and is a staple food source in many parts of the world. Forage types are used mainly for animal feed and sweet sorghum is used like sugar cane mainly for ethanol (alcohol) and bagasse production. There are many plant derivatives that have been hybridized for rate of growth, compositions, yields and adaptations to regional conditions.

Sorghum grows in many areas where corn will grow. The limitation of sorghum is low temperature as the plants need average temperatures of eighty degrees F. during July and daytime temperatures of ninety mid-day. This limits the northern planting range to close to

Central Wisconsin. Soil temperatures are critical as 60 to 65 degrees are needed for plant emergence.

In the U.S. major seed producers include DEKALB (Monsanto MON \$105.62) and Pioneer Hi-Bred (DuPont DD \$68.73). S&W Seed has a relationship with Monsanto through its alfalfa GMO program and a very strong relationship with Pioneer.

SANW has signed a new license agreement for the production and marketing of two sunflower varieties for the markets of the Ukraine (the world's largest producer), Russia (number 2), Belarus, Georgia and Kazakhstan. The Ukraine and Russia represented 48.5% of the production volume of estimated 43.3 tonnes in 2013 [FAOSTAT data, see below on page 3].

Latest data available show a decline overall acres planted over the last few years. However, this is not relevant to SANW since they are just a very small entrant into this market.

Sunflower Seed	2010/11	2011/12	2012/13	2013/14	2014/15 Revised	2015/16 Forecast

S&W Seed Company announced on May 31, 2016 that it had acquired the assets and business of SV Genetics Pty Ltd (SVG) based in Queensland Australia. SVG sells proprietary hybrid sorghum and sunflower germplasm. S&W stated that this expands its product portfolio into two

complementary crops, provides diversification into higher margined products and leverages its existing infrastructure. The hybrid products can be sold through S&W's existing distribution channels and, particularly where Sunflower seed is sold, open new markets for S&W in Eastern Europe. SVG's breeding program has developed a portfolio of proprietary products for both forage (S&W's traditional alfalfa market) and grain sorghum and for sunflower seeds that generate higher yields than its competition. SVG licenses its seed genetics as well as selling the parent seeds. There are currently 14 partners that grow plants in 7 locations that provides seed to SVG. 57 potential commercial partners are testing products in 20 countries.

The purchase price is \$1 million in cash (S&W had \$6 million in cash t the end of 3Q16) and 0.225088 million shares (worth \$1 million at the time of the transaction or \$4.44271 a share), paid at closing. There is an \$3.3 million earn-out if SVG achieves \$6.1 in net income for the 2019 and 2019 fiscal years combined.

Both sorghum and sunflower are major crops (based on metric tons of production. Certain sources measure crop ranking by acres under production and rankings may change). As shown below the United States is by far the largest producer of sorghum (biodiesel is a significant market and the sugars in sorghum can also be used to make ethanol), followed by Mexico and Nigeria. Australia is a small producer and Europe is not a significant producer.

Eastern Europe is the major area of production of sunflower. Sunflower oil is also becoming popular as a source of biodiesel since the plant is easy to grow and the oil is similar to canola oil. Plant biodiesel has long been a major auto fuel in Europe.

	Country	Production (1000 MT) Sorghum
1	United States	15,158.00
2	Mexico	7,150.00
3	Nigeria	6,150.00
4	Sudan	5,500.00
5	India	5,500.00
6	Argentina	3,900.00
7	Ethiopia	3,800.00
8	China	2,900.00
9	Australia	2,200.00
10	Brazil	2,000.00
11	Burkina Faso	1,900.00

Note: Much of the international data is in metric tonnes (2204.6 pounds) and the US data is in tons (2240 pounds)

On May 12, 2016 S&W Seed announced its third quarter results. Revenue was \$1 million above our estimate of \$25 million at \$25.01 million. Cost of sales was \$19.5 million versus our estimate of \$19.9 million. Operating costs were kept under control, \$3.9 million as compared to our estimate of \$4.1 million and, excluding the profit from sale of property, operating income was ahead of projections. Other expenses and interest expense were far greater than expected but were offset by the \$2.4 million profit from the sale of property.

The company stated that it was still on track for \$95 million in revenue for the year with a slight reduction in margins in the 4Q16 as compared to the 3Q16.

In 2017 fiscal year there will be significant increases in acres planted in the USA with products based on Pioneer Germplasm up by about 40%. The harvest in Australia was close to average this year but added acres and possible a good growing season could increase the seed for sale next year by a significant amount.

S&W Seed is “ready” to plant seed that is Roundup Ready. The GMO seeds sell at a premium to other varieties which should add to revenue. However, royalties have to be paid on these seeds which will moderate the profit margin.

The gene editing collaboration with Calyxt should lead to some planting trials this fall. This alfalfa is not considered to be GMO based and could be sold worldwide.

With revenue up 17% for the nine months, further gains possible from higher yields in the USA, increased acreage and the introduction of new varieties for 2017 sale the company now has a solid foundation for next year.

On April 04, 2016 S&W Seed announced that It had filed another patent application for a new stevia variety. This variety, SW 227, contains a higher ratio of Reb A to stevioside with a lower amount of stevioside and, consequently has a less bitter taste than other varieties. 227 contains 10.7% of Reb A and is aimed at the whole leaf market (both fresh and dry leaves).

This is the fourth patent S&W application for varieties of stevia. The first was applied for in Sept. 2014, eighteen months ago. This is about the length of time it takes for a patent of this type to be approved.

China produces about 80% of the supply of stevia leaves consumed worldwide and we noticed that in the 10Q for the second quarter it was reported that revenue from China was broken out for the first time. We doubt that this was stevia but it is interesting that the company has established sales contacts selling into China.

The recent rights and stock offering were taken down and the company raised \$8.8 million gross. The company issued 2.125 million new shares, slightly less than the 2.5 million we had expected. The new share count is 16.813666 million shares outstanding. We presume part of this cash will be used to buy back some of the 8% convertible debentures.

Second quarter revenue was far higher than our forecast because DuPont/Pioneer Seed had requested that seed be delivered in December 2015 rather than January 2016 and S&W Seed was able to do this. Since the guidance for the full year was not changed we have adjusted the third quarter to reflect the change.

The company has made two moves that will significantly impact revenue and margins going forward. Significant increases in available acreage, amounting to at least a 45% gain from 2015 calendar levels to generate more seed for Pioneer and an overall companywide increase of 15%, will allow S&W Seed to expand into more markets where it has been limited in the past. Much of this new acreage will be available in the third quarter of fiscal 2016. S&W Seed has also ended many contracts the company absorbed the farmer and yield risk and all contracts are now based on straight purchase of seeds. This should have a marked increase in gross margins in future years, possibly as much as 3% or 4% additional margin.

S&W Seed has distributed non-transferable subscription rights to buy shares of stock for \$4.15. The company will sell 576,923 shares of stock for a total number of 2.5 million shares and \$10.375 million. Two major shareholders, MFP Partners, L.P. and Mr. M. Harvey, Chairman of the Board of SANW have participated to the fullest in the offering.

The company has filed its third patent application for a stevia plant derivative. This variety, SW 129, is aimed at commercial use because of its high Reb-A content. SW129 produces leaves with high levels of desired glycosides without the bitterness and aftertaste that is common in current plants grown in India and Asia. This variety has almost twice the Reb-A content and nearly five times the ratio of Reb-A to stevioside than normal. This variety is a vigorous plant that winters well, is late flowering and produces an abundance of leaves. The yield is over 2,500 pounds of leaf per acre for each crop. SW129 was harvested twice a year but many commercial growers crop three to four times a year. This variety would be ideal for planting in moderate climates such as the North Western United States or central Europe.

The time between filing for and the granting of a patent varies but is often about 12 months after the receipt of the application by the patent office.

The use of stevia in soft drinks has resulted in many companies such as Coca-Cola (KO, NYSE, \$43.20), Cargill, and PepsiCo (PEP, NYSE \$100.67) in filing for patents on modified glycosides, including Reb-M for example, that reduce the bitter aftertaste but there are few companies other than S&W Seed that are working on developing plant varieties that optimize the desired amount of the best artificial sweetener.

Including the three major areas of cultivation it is not unusual for one, or even two, areas to have decline in yields. This may be due to lack of water at certain times, low levels of pollination or other environmental factors. Using a 30 year average yield per acre S&W Seed thinks that yields are down, possibly as much as 20%, in all three areas. This is causing price increases, especially at the lower end of the price structure, as farmers scramble for seed to meet their forage requirements.

The company expects to increase its acreage by 8% over the next year. This is comprised of an 18% increase in owned acres in dormant varieties and a 6% increase in acres for non-dormant varieties. As yields move back to the 30 year averages (as they always do over time) in one or two areas we expect revenue growth in excess of 10%.

S&W Seed's Round-Up Ready alfalfa is currently being harvested. This crop will be checked to ensure that the gene insertion has been achieved and future generations will reproduce the traits. The company is selling Roundup-Ready seeds produced through the Pioneer acquisition and expects to add its own proprietary products for sale next year.

The data for the third stevia patent is complete and data for a fourth patent is being worked on. The first plant patent should be granted in about a year, at which time S&W Seed will finalize its strategy for development of stevia and generation of revenue.

At this time there are two companies in the Stevia market. Two of these are not profitable and Stevia Corp. has minimal revenue with substantial losses. However, Sunwin Stevia is profitable and expects \$25 million in Stevia extract sales with a 24% gross margin in the coming year. Sunwin's market cap is \$25 million, or one time future revenue. Since SANW's price to sales is 0.76 times we would expect an improvement in valuation as stevia revenue materializes.

On Sept. 23, 2015 the company announced that it has negotiated a new line of credit for \$20 million with KeyBank National Association to replace the current line with the Export-Import Bank. The new line has a variable rate based on short term market rates. This will save about 75 basis points from the prior loan rate. It is backed by eligible accounts receivable and inventory. The commitment extends through Sept. 22, 2017. Lines of credit are used when current cash accounts do not cover other working capital requirements and it is not possible for us to calculate how much would be needed. At the end of fiscal 2015 accounts receivable and inventory totaled \$52 million, accounts payable was \$15 million and cash was \$3.5 million.

S&W Seed has completed the building of a new seed packaging facility in Keith, South Australia. This facility is expected meet the needs of expanding seed production in Australia at a lower cost than current facilities.

On Sept. 16, 2015 S&W Seed announced its fourth quarter and full year 2015 results. Revenue and gross margins were very close to our published forecasts. However, operating expenses and other expenses, together with a negative tax rate, were much higher than expected, resulting in a reported loss rather than a profit. Most of the increases in expenses were due to the addition of the Pioneer alfalfa operations, including acquisition expenses, plus foreign currency losses and the amortization of the debt discount. Overall non-GAAP Adjusted EBITDA increased dramatically, from \$1.6 million a year ago to \$3.0 million in 4Q15. For the full fiscal year non-GAAP EBITDA doubled as compared to a year ago. Non-GAAP earnings were \$0.05 a share and GAAP losses were \$0.02 a share.

The Australian bumper alfalfa crop of two years ago has now been absorbed and inventories of lower priced seeds are very low. The net result is that the spread between higher priced proprietary seeds and lower priced seeds has narrowed. Last year was an average crop and this year has been well below average. S&W Seed expected seed production to be in the order of 8 million pounds but actual production will be closer to 6 million. The shortfall should be made up by selling seed from US inventory plus higher prices.

The net result will be a drop in volume offsetting an increase in selling prices. The company is forecasting 2016 revenue at \$95 million, as compared to our estimate of \$96 million.

S&W Seed expects to file another patent on a stevia derivative this year. Down the road we would expect some royalty income from licensing the patented varieties.

Now that we have a better picture of the seasonal fluctuations in revenue (remember that winter in N. America is summer in Australia) we have adjusted our revenue and earnings forecasts. The 1Q16 had been reduced, since it will comprise of N. California sales (currently being harvested) and both the 3Q16 and 4Q16 have been increased. The net result is a slight increase for annual revenue in our 2016 forecast.

The original purchase agreement of Pioneer Hi-Breed's alfalfa operations included cash transfers of \$4 million in 4Q15 (April 2015), \$13 million in November 2015 (2Q16), \$13 million in January 2016 (3Q16) and \$14 million in April 2016 (4Q16). The payment due in 2Q16 will now be received in September 2015 (1Q16). This will have a positive impact on cash flow at a time that S&W Seed will be building inventory for sale later this year.

S&W Seed and Calyxt announced on June 09, 2015 that they will research and develop new varieties of alfalfa based on S&W Seed's products and Calyxt's proprietary gene editing technology. Genome editing technology has been applied to plants, especially wheat and rice, and Calyxt has produced gluten reduced wheat and canola oil with lower saturated fatty acid content as well as a non GM variety of soybean that has reduced levels of linoleic acid, which produces trans fat when soybean oil is treated for human consumption. Calyxt will produce the modified seeds and the two companies will commercialize products through their own distribution channels. Under current regulations the products would not be considered as GMO since no gene insertion occurs.

On May 14, 2015 S&W Seed reported its third quarter results, the first quarter after acquiring the Pioneer alfalfa operations. Earnings were impacted by over \$3 million of non cash charges resulting from the acquisition. Without these the company would have earned \$0.20 a share. Some of these charges will continue, in lesser amounts, through 2016 and into 2017. March was stronger than expected by management which pulled revenue above the company's guidance. This may have borrowed from the fourth quarter since some shortages of seeds occurred in the USA and Arabia but we expect the 4Q15 results to be close to those of the 3Q15. Margin expansion due to the Pioneer business was met by better pricing abroad and margins from the legacy business was close to that of the seed sold through Pioneer. We expect some margin decline from the 3Q15 to the 4Q15 for US sales offset by the much higher margins from the Australian business that is being harvested now.

Currently there is no problem due to the extreme drought conditions in California. Seed from the San Joaquin Valley is primarily purchased under contract from farmers that have access to water and Imperial Valley acres are watered with Colorado River water purchased under contract.

The company is expanding its acres owned and under contract. Some, in the NW USA, will be planted with dormant seed and the Australian operations are acquiring property in NSW and Victoria for growing non-dormant varieties. The Australian additions have been used to grow cotton (an annual crop that requires a fair amount of water) and this should produce a good yield per acre.

Round-Up resistant seeds have been planted and sales should occur in 2016.

New greenhouses are being built for the germination and growing of Stevia plants. A third patent will be applied for this year. Plants will be sold to growers and there may be some sales in late fiscal 2016.

S&W Seed has begun the development of alfalfa varieties that combine the best characteristics of the best selling Pioneer seeds with those of certain S&W Seed varieties. This is to improve such things as yield, drought and heat resistance. The result will be to expand the geographical coverage (increase available market) of the dormant alfalfa varieties. This is a long term effort that will have a long lasting effect on the markets.

The company has filed a 8-K with the SEC regarding the impact of the 8% Senior Secured Convertible Debentures and the warrants on the number of shares outstanding. The NASDAQ requires such a filing if the full conversion would result in the increase of more than 20% in common stock outstanding.

During the second quarter demand in the Middle East was very strong as inventory levels declined from the high levels caused by record crops in Australia. More normal crop levels and increased demand had a positive impact on prices, with some commodity type seeds increasing in price by over 25%. At this time world wide inventory levels of proprietary seeds is low and there is very little inventory of low end seeds. In the Middle East inventory has been depleted. This has pulled some expected revenue from the fourth quarter into the third quarter.

The addition of the Pioneer dormant stable of products is having a beneficial side effect on order inquiries from S&W Seed's traditional market. The company can now offer a customer a full range of seeds in both the dormant and non-dormant markets. Customers can make the company a "one stop shop" for all types of alfalfa seeds. The company will have to increase its available acreage to fill potential orders from Canada and the State of Washington.

S&W Seed is now preparing acreage for the production of Round-Up tolerant GMO seeds. This will result in seeds for sale in the 2016 fiscal year.

The company now has an exclusive distributor in China. A container of seeds is being shipped but the dock slowdown on the West Coast is delaying some shipments. The tropical alfalfa variety currently being tested is generating significant interest.

The second half of fiscal 2015 and all of 2016 will carry a heavy burden of both cash and non cash interest expense due to the convertible stock issued for the acquisition. However, since the convertible can be redeemed at the company's option, if the stock price exceeds \$5 a share there may be significant conversion of the debt into equity, thereby reducing interest expense but increasing shares outstanding.

On Jan. 26, 2015 the company announced the sale of two properties in California for an aggregate of \$7.3 million, the pay down of a mortgage of \$2.3 million and the redemption of \$5 million of the recently issued convertible debenture. We would anticipate further redemptions from cash flow in fiscal 2016. The two properties sold were 759 acres in Calipatria in the Imperial Valley and 30 acres of farmland in Five Points, near to the company's HQ. The property in the Imperial Valley will continue to produce S&W Seed's proprietary alfalfa seed under contract. The Central Valley property was not under cultivation at this time.

The redemption of the debentures will have a double impact on the income statement. It will save about \$0.125 million in interest cost per quarter and will reduce the potential dilution when the company reports a profit. The sales will result in a charge to earnings from work in progress of \$0.5 million in Q2 and \$0.126 million profit on the 30 acres in Q3.

S&W Seed has announced the appointment of Dr. Mark Smith to the position of Director of Breeding and Genetics. Dr. Smith will have primary responsibility for continued R&D on the dormant alfalfa varieties acquired from Pioneer Du Pont and will be working with S&W Seed's integrated R&D group on further research on non dormant varieties as well as the development of GMO varieties.

Previously S&W Seed had announced the appointments of Kirk Rolfs as VP of production and Robin Newell as VP of N. American Sales.

Mr. Rolfs will be responsible for relationships and contracts with S&W Seed's growers as well as management of the newly acquired seed processing facility in Nampa, Idaho. His career includes management of Pioneer's non-dormant seed production in the San Joaquin Valley as well as Quality Supply Logistics as well as world-wide distribution planning and Supply and Demand Planning.

Primary responsibility for N. American Sales will lie with Mr. Newell which will include distribution relationships with DuPont Pioneer. The development of private label business relationships for dormant varieties will also be part of his responsibilities.

On January 8, 2014 S&W Seed held a conference call to discuss the purchase of Pioneer DuPont's alfalfa operations.

S&W Seed will receive a prepayment for the delivery of seed to Pioneer for resale. It has, in fact been paid \$22 million for seed that will be sold, on an accounting basis, later this year and will receive another \$4 million in April, 2015. Sales under the agreement will be recorded as \$16.9 million in the third fiscal quarter and \$9.1 million in the fourth quarter. The deal includes a provision for a 4% a year price appreciation of the seeds sold to Pioneer.

In the 2016 fiscal year the company will record sales of \$26 million in Q3 and \$14 million in Q4 but will receive \$13 million in cash in November 2015 (Q2), \$13 million in January 2016 (Q3) and \$14 million in April 2016 (Q4). These cash payments will be sufficient to cover working capital requirements such as payments to growers.

The deal is of great benefit to S&W Seed. The dormant seed varieties developed by Pioneer have a high yield as compared to most of the competitive alfalfa varieties. The current market is for the "snow belt" from NY State, through Canada and the upper Midwest, into Alberta and back down to Montana and Idaho. This is a large potential market. The company stated that 80% of the US market is for dormant alfalfa and Pioneer is the largest company in that market. We estimate that S&W Seed will have access to well over 10,000 acres of contracted farmland for growing dormant seed varieties.

Pioneer has been selling GMO alfalfa for about three years. S&W will continue to grow these plants but will not acquire the rights to the varieties for a couple of years.

The acquisition will enable S&W to grow seeds for overseas markets such as China, where it already has established a presence. It can also sell its own varieties through the Pioneer sales organization to its own customers if they wish to do business that way.

To pay for the Du Pont Pioneer acquisition S&W has raised \$31.7 million through a combination of convertible debt with warrants and the sale of stock. The increase in shares, assuming the convertible is converted to common stock, is in line with our assumptions and our estimates have not been changed.

The company will sell 1.294 million shares to MFP Partners LP at \$3.60 for \$4.66 million. These shares will be registered.

Up to \$27 million of senior secured convertible debentures will be sold in a private placement to accredited investors. These will have a coupon of 8% a year paid monthly and will mature after 35 months. The interest can be paid in common stock or cash at the option of S&W Seed. The conversion price is \$5 a share. Starting on July 01, 2015 the debentures can be redeemed in stock or in cash.

The sale of the debentures will include up to 2.7 million warrants. The debentures and warrants have not been registered. The warrants strike price is also \$5 a share.

S&W Seed announced on December 19, 2014 that it will acquire the alfalfa operations of Du Pont Pioneer. We assume that this is the result of the resumption of the talks that ended in October, 2014. The stock reacted strongly to the news in after-market trading and closed up 25% for the day.

S&W Seed will purchase all of Pioneer's non-GMO alfalfa operations, assets and research facilities. This includes 31 current employees. The cost is \$27 million in cash on signing, a \$10 million promissory note at 3% interest and \$5 million earn-out payable in 3 years. The company will also buy the GMO alfalfa germplasm developed for extending their sales, these apart from those developed by S&W Seed for its varieties, subject to certain (not specified) conditions for \$7 million at the end of 2017.

The deal includes over 15 seed varieties on the market that generate about \$40 million a year in revenue. There are over 60 varieties in development. A seed cleaning and production facility in Idaho is included, which means that S&W Seed now has access to three seed cleaning facilities. There are research facilities in Wisconsin.

Du Pont Pioneer will continue to sell alfalfa seeds through its own sales representatives but they will now be produced by S&W Seed under a ten year exclusive arrangement. It is possible that S&W Seed can leverage its own varieties by selling those to Pioneer

We do not know how Pioneer obtained its seed. It is probably through contract growers since no land is included in the deal. Some of the seed varieties may thrive in either the Sam Joaquin or the Imperial valleys, which could well leverage earnings in the future.

On December 11, 2014 S&W Seed announced changes to the Board of Directors with Mark Harvey becoming Chairman and Mark Wong joining the board. Mark Harvey was one of the founding members of Seed Genetics International of S. Australia before it was acquired by S&W Seed in April 2013 and he became a member of the Board of Directors of S&W Seed. He has had many years of experience in managing an international seed business. Mr. Wong is described as having many years of experience in agribusinesses with an emphasis in the development of engineered proteins and seed development. He is also well versed in the financial side of mergers and acquisitions.

S&W Seed announced on Dec. 09, 2014 that it has filed for a patent on a stevia variety, SW201. This is the second filing for a stevia variety by the company. The leaf of this variety has an improved taste profile as compared to traditional varieties. Fresh or dry leaves can be used to sweeten beverages or to be added, like herbs, whilst cooking. SW201 can also be grown in home gardens.

Stevia leaf is sold in health food stores as well grocery stores and through the internet. The overall stevia sweetener market is worth about \$550 million (Zacks estimate for 2015) but there is no market data for the sales of leaf or plants.

On December 08, S&W Seed announced that Grover Wickersham would step down from the post of Chairman of the Board prior to year end 2014 but would remain a Director of the company.

Mr. Wickersham founded S&W Seed as it is today after he acquired the partnership that had owned it. Following the building of the current senior management he took the company public in May of 2010. Since that time S&W Seed has become the largest producer of non-dormant alfalfa seed in the world. He has also played a significant role in the development of high yield stevia plants. Grover continues to be a major stockholder in the company.

In early September, 2014 S&W Seed provided an update on its progress with stevia. It was in the progress of compiling data and preparing for patent applications (please note the plural) for stevia varieties (plural again) with improved flavor profiles. Today the company announced that it has filed for one stevia plant variety known as SW107. This suggests that more patents will be filed in other varieties. SW107 has an improved aftertaste profile which is important when stevia is used in cooking. SW107 is a more vigorous plant, has more leaves than the usual varieties and the leaves have a higher concentration of Reb-A, which is the primary sweetener currently used. The ratio of Reb-A to stevioside concentration is more than double the ratio found in current plants. The plant better withstands cold weather than does the type of plants grown in China.

The first major market for stevia was Japan and this encouraged the farmers in China to expand crop production close to the market. The US is now a major, if not the largest, market for the purified glycoside and SW107 has been optimized for growing in North and South America, that is closer to the market. In field trials in the western United States SW107 produced about 40% more leaves than samples from large production facilities.

S&W Seed announced on Nov. 20, 2014 that it has made its first sale to a distributor in the Republic of Turkey. This follows the announcement earlier this year of expanding into Argentina. The company is likely to expand the number of distributors in Turkey as part of its strategy of geographical diversification.

The initial sales will be of seed varieties already registered in Turkey by Seed Genetics and are sourced from S. Australia. The current market in Turkey is fragmented and consists of lower quality seeds (lower priced). Seeds sourced from Australia have a lower cost basis than seeds from California.

The estimated market is about \$12 million with the current sales mix. However, there is a significant opportunity for S&W Seed to introduce higher yield varieties at higher prices once its presence is established.

On Nov. 1, 2014 S&W Seed Co. announced its first fiscal quarter of 2015. Revenue was slightly higher than guidance and net income was in line with our estimate. Second quarter revenue guidance is \$12 million. In our opinion the company will fall short of the 10% increase in annual revenue that has been projected due to seed usually sold in Argentina being diverted to Saudi Arabia.

The glut of lower priced seed due to the record harvest in Australia last year is working its way through the system. Prices are improving for seed grown in Southern Australia, increasing from \$4.00 a kilo to \$4.40 a kilo over the past few weeks. However, the excess seed in the market will impact the second quarter as farmers buy the cheaper seeds still available.

The second half of the year should be better, more in line with prior years, as seed from California is sold into the market. Instead of producing seed some farmers are feeding the alfalfa to cattle as the hay price is still high in the western States and about 6,000 acres has been taken out of seed production. There is very little seed available for sale in Canada at this time.

The company will use about 200 acres to grow Round-Up resistant alfalfa seeds and should have seeds for sale in about a year from now (November 2015)

Stevia patents may be extended to other parts of the world depending on where the plants are grown but meaningful revenue from stevia is unlikely for about two years.

A few years ago when alfalfa seeds were being dumped onto the Saudi market S&W Seed withdrew from the market until conditions stabilized. With some seeds currently being sold at less than cost we would expect the company to mirror its previous actions. California produced seeds are selling well in markets outside of the Middle East.

The plant patents on the Stevia plants should be filed before the end of the calendar year. These plants should have a better flavor profile (there are many flavor components in the leaf and not all plants have a desired flavor) as well as a higher concentration of Reb. A.

The company announced on September 25, 2014 that it has entered into a distribution agreement with Maxim International (Private) Limited for Maxim to be the exclusive distributor of all of S&W's elite alfalfa seeds in Pakistan. Maxim is one of the largest provider of farm products in Pakistan, selling directly to more than 2,000 farms and to over 2,000 distribution partners. The country has a fast growing beef and milk production industry and the current alfalfa market is predominantly commodity uncertified (growing low quality forage) seed. S&W has a long history of stable relationships with significant distributors, especially in the Middle East.

S&W Seed announced Sept. 10, 2014 that it will form a fifty-fifty joint venture with Bioceres S.A. in Argentina to develop and sell GMO and proprietary alfalfa seeds in Argentina. At this time there are no sales of GMO alfalfa in Argentina. Bioceres is similar to a farmers coop with over 270 shareholders, most of whom are farmers, that plant nearly 2.5 million hectares. (about 6 million acres) in Latin America. Currently the members are not growing or marketing alfalfa

through Bioceres and the JV is a means whereby the farmers can buy seeds with consistent characteristics for yield and dormancy. S&W Seed has not sold its California grown seeds in Argentina. The JV will be a vehicle for S&W Seed to penetrate the Latin American market, mainly Argentina. S&W Seed will sell to the JV and the members will buy from the JV. S&W Seed has a number of brands already registered in Argentina. It will be possible for Bioceres members to buy seeds from the JV as long as they are registered varieties. Bioceres is actively working on modifying plant structure to adapt plants for abiotic changes (changes that affect plants apart from biological changes) that include drought tolerance, salt tolerance, extreme changes in temperature or wind conditions, acidity (pH) changes, and even tolerance to rapid moisture changes that can effect seeds during germination. Bioceres has developed modified root structures on legumes so that the plant develops longer roots. Bioceres is working on incorporating genes derived from sunflowers and has already inserted these into wheat seeds. Many of these plant modifications are similar to those developed over the years by S&W Seed using its own genetic selection methods to breed drought and salt tolerance capabilities into alfalfa.

Argentina is the third largest market for alfalfa seeds after Mexico and Saudi Arabia with about 17 million acres under alfalfa. There is the normal crop rotation of one third of the acres replanted every year leading to a market of 6 to 8 million pounds of alfalfa seed. The market is fragmented with over 30 seed suppliers and no dominant supplier. Argentina is one of the largest producers of GMO crops.

The company has announced that it will apply for patents on stevia varieties that have improved glycoside profiles (including increased concentrations of Reb A.) and possibly more vigorous plants that would have more leaves. The combination of greater yield and a better taste profile would make these varieties attractive to potential stevia plant growers. Trade sources report that high purity Reb A. sells for over \$50 a pound so the increased concentration has a significant value.

S&W Seed now has four avenues for marketing its stevia products. These are from selling leaves (dried or fresh), selling immature plants (stevia traditionally has had a low germination rate in the fields), selling seeds and granting a grower a license to use S&W Seeds to grow the plants. Collaborative agreements to develop other varieties is also possible. Granting a license to grow patented varieties could involve up-front royalty payments. The sale of intellectual property rights can be very profitable since the cost of development has been absorbed in prior periods.

S&W Seed announced on August 05, 2014 that it has contracted the production of its high yield California alfalfa seed varieties in about 1,000 acres of land in Australia. The initial (meaning more acres later) planting will be harvested in the Australian harvest period of March and April in 2015. The costs of production are lower in Australia than in California. Assuming comparable yields this production should have a modest but positive improvement in gross margins. The

costs of shipping seeds from Australia to the Middle East are about the same as the cost of shipping from California.

The company has four basic strategies (these are not triggers or events) that do, to a certain extent, overlap. These are:

- A) Expand current production by adding acres or using higher yield varieties.
- B) Introduce higher value varieties in place of lower value (often commodity) seeds.
- C) Add Round-Up Ready alfalfa seeds in those areas where it is legal to do so.
- D) Produce proprietary Stevia seeds possibly to be sold to its partner Pure Circle.

All of these strategies should grow sales with products that carry much higher gross margins.

Following the successful trials of S&W Seed's dormant alfalfa seed in China the company has announced the first sale (and export) of its proprietary seeds to the Chinese market.

The dormant market is at least as large as the non dormant market, although a significant part of the dormant market is commodity product. It appears that S&W Seed has been able to produce commercial quantities of high yield varieties that can be sold into the Asian market. China is the highest growth area in the world for the use of alfalfa as feed in the dairy market.

This is the first of three major events that are expected to drive revenue and earnings over the next few years. The others are the introduction of high yield GMO alfalfa varieties and the sale of proprietary varieties of stevia seeds for the sweetener market.

Stevia is still alive! The company has developed strains that have superior and desirable flavour profile. The plants are vigorous and should grow well in China and India. S&W Seed will not grow and sell leaves but will sell seeds. This is a departure from the original plan of selling leaf to Pure Circle.

S&W Seed expects gross margins to improve to the high 20s over the next few years as proprietary seeds replace commodity seeds in Australia, China becomes a significant market in 2015 and new varieties of dormant alfalfa are grown and the seeds sold.

On May 13, 2014 S&W Seed entered into an agreement with Imperial Valley Milling Co. (IVM) for IVM to process seeds from S&W Seed in a tolling arrangement. The alternative was to ship the unclean seeds to the plant in the Central Valley and process them there. However, in our opinion, the N. California plant will be used to process the Round-Up Ready treated seeds and

the current agreements with IVM will prevent contamination seeds for sale in markets that prohibit the sale of GMO plants.

S&W Seed announced in June, 2013 that a new strain of alfalfa, RD 132, has entered third party testing for traits suitable for growing alfalfa in tropical climates. At this time there is no crop that offers the productivity of alfalfa that is grown in tropical climates so this is a new potential revenue stream for the company. Developed by Seed Genetics, starting in 2008, RD 132 has been tested by Seed Genetics and S&W Seed in the tropical areas in N. Australia. It is one of four candidates that have been grown and tested for disease resistance in tropical climates and RD 132 is the most advanced. Testing will proceed for 10 months and the seed will then be introduced into the market place. We would not expect a significant amount of revenue from this variety before fiscal 2016. This will give S&W Seed time to set up a sales organization in Central America, equatorial Africa and SE Asia. Few leguminous and fodder varieties grow in the tropics (rice is too important to be fed to cattle) and there is a need for a seed to grow high quality and productive crops such as alfalfa.

As the proprietary seeds from S&W are grown by IVS we would expect the beginning of a three year cycle (alfalfa has a three year life in the field) where higher average seed prices drive gross margins higher. Also with SGI, starting late in fiscal 2014, assuming the weather cooperates, S&W varieties for the Mid Eastern markets can be grown in Australia.

Other drivers are converting the IVS land from commodity alfalfa to proprietary non dormant varieties and the introduction (in 2015/6) of RoundUp-Ready varieties. S&W Seed is making a significant effort in educate farmers in the advantages of its high yield varieties. A \$30 increase in seed costs per acre can generate a \$200 (or more) increase in alfalfa revenue per acre per year. Since the crop is harvested for three years before replanting this is a major selling point. This could easily double its current revenue over a five year period.

With its recent acquisitions of land and the expansion of leased land under cultivation S&W Seed is one of the largest producers of non-dormant alfalfa seeds in the world. Trade sources suggest that the company could soon be the number one commercial producer, bigger than Dow, of proprietary alfalfa seeds.

Enhanced stevia plants:

Stevia demand in the US is amongst the highest in the world. It is now possible to buy fruit flavored drinks that are sweetened with stevia. A stable and dependable source of stevia leaf in the US is important to the producers of the steviol glycosides. The extraction of the glycosides is not much more difficult than making a cup of tea and is not capital intensive.

S&W Seed has been working with Dr. Clinton Shock for a number of years. Dr Shock, whilst in the Peace Corp. in Paraguay, developed an interest in stevia and collected many samples of stevia plants and seeds from remote villages. Many of these are atypical examples of wild stevia,

and they have been made available to S&W Seed. Some of these samples have been crossed with each other and seeds grown and tested for glycoside types and concentrations. In the photo below Dr. Shock is standing behind some of the plants that are substantially bigger than the plants sourced from China (as seen in the background) The monster plants are at least waist high whereas the others are knee high.

These plants have substantially more leaf mass the leaves contain higher concentrations of Reb. B and Reb. C but, at this time, lower concentrations of Reb. A. Further crossing and selective breeding could lead to plants with higher Reb. A concentrations whilst maintaining the high plant mass.

Stevia:

The revenue from the stevia sold in the first quarter of fiscal 2012 will be recorded in the second quarter. On Nov. 10, 2011 S&W announced that the stevia leave provided to PureCircle passed all of the required specifications for Reb. A content, moisture content and low levels of contaminants such as seeds, stems and branches.

Although the stevia plant can be stripped of leaves up to three times a year the optimum Reb A concentrations would probably occur with an annual harvesting. Selective breeding for the maximum Reb A content will continue.

The Official Journal of the European Union has published regulations permitting the use of stevia sweeteners in European Union. This will allow the sale of products made with stevia as soon as December 2nd, 2011. PureCircle stated that this permission could increase the overall potential market by 50%.

PureCircle has announced the launch of a new flavor modifier, NSF-02, that works with stevia based sweeteners, Reb A and SG-95 as well as HFCS.

SG-95 is a stevia rebaudiana based glycoside that is sold as a sweetener. It is a Diterpene glycoside whose structure was recently identified by scientists at the Coca-Cola labs in Atlanta GA.

In the first six months of 2011 there 15% more foods and beverages announced than the same period in 2010. Over 40% of these were announced in the United States.

Foods & Beverages Launched With Stevia

Source: Datamonitor, January – July 2011

From the 10K:

S&W Seed recently filed its 10K. Part of the filing discussed the reduction in revenue in 2011 versus 2010 from Saudi Arabia of \$2.4 million. In the fourth quarter of fiscal 2011 the company had significant sales to a Saudi customer, confirming that the market has turned up. Our revenue estimates assume that the current market strength continues, the price increases hold, there is a little revenue from stevia and the Saudi market contributes \$2.5 million to this year's revenue.

PureCircle comments:

S&W Seed reiterated the comments made by PureCircle last August and announced that the two companies will continue to work together and expand the production of stevia by leveraging S&W Seed's relationships with its growers of alfalfa in the Central Valley of California. PureCircle will continue to work with S&W Seed in cultivating multiple breeds of stevia with higher concentration of glycosides. The first crop will be shipped to China in a few days.

Stevia Update:

We are assuming that no meaningful revenue will be generated from Stevia in fiscal 2014, 2015 or 2016.

A report on the internet (<http://health.yahoo.net/rodale/RH/the-4-best-and-3-worst-sweeteners-to-have-in-your-kitchen>) stated that Coke and Pepsi got the green light to use Pure Circle's Truvia (the leading stevia sweetener).

The company has exclusive rights to use improved stevia plant varieties collected by Dr. Shock of Oregon State University. Testing for Reb A sweetener concentration is currently underway in S&W Seed test plots. As the company plants and harvests plants with better Reb A values we would expect higher prices per pound.

Truvia (stevia/Reb A from Pure Circle) is now the second highest selling sugar substitute in the United States, passing Sweet N' Low in about two years after its commercial introduction, with the overall Stevia market exceeding \$500 million a year.

S&W Seed's value to Pure Circle is being able to produce more productive plants using cross breeding of plants currently in test plots. As the US market grows sweetener companies will have to treat the leaf closer to the market than Asia, and S&W Seed will be a pivotal player in this market.

The Alfalfa Market:

The shortage of alfalfa hay (due to low levels of planted acreage in late 2010 and early 2011) has caused significant increases in prices. (Source: The Hoyt Report, Inc.). This will pull acres back into alfalfa plantings, increasing the demand for seeds from S&W Seed.

S&W Seed buys international distributor:

The company announced on July 8, 2011 that it has purchased its international distributor, Genetics International (GI, owned by Richard Penner), with which it had a relationship for over 20 years. GI had generated nearly 50% of S&W Seed's total revenue in prior years but, due to profitless pricing of alfalfa seed in Saudi Arabia there has been no revenue in fiscal 2010

The acquisition of GI will increase margins on sales that are made to GI's customer list, less the 3% commission paid.

Stevia news:

On May 18, 2011 the company released an update of the stevia situation. 114 acres are ready for planting. Seeds were sorted before planting and this significantly improved the germination rate. About 3.8 million plants will be planted using commercially available tomato planting equipment. Assuming reasonable weather the first cutting should occur by September 2011.

At this time yield per acre is unknown but trials have yielded over 5,000 # per acre of dried leaf with three cuttings. We are assuming 1,500# per acre for each cutting and a price to S&W Seed of \$0.90 a pound.

The leased land mentioned below is being prepared for planting and a drip irrigation system is being installed. Since we do not know what crop(s) will be planted and on how many acres we have not included any revenue from this land in our current estimates.

New distributor:

On 04/06/11 S&W Seed Company announced the expansion of its distribution network with the addition of an international distributor of forage crops currently serving international agricultural markets. The new international dealer issued a purchase order for alfalfa varieties for \$260,000 which should be shipped within 30 days, and is anticipated to represent the first of several orders from this new distributor over the coming months.

New line of credit:

On 03/31/11 the company announced that it has completed an agreement for a one-year, revolving line of credit with Wells Fargo Bank National Association with maximum availability of \$5,000,000. The outstanding principal balance of the line of credit will bear interest at one month LIBOR plus 2%, which presently equals 2.25% per annum. The line of credit bears a standby fee on one-half percent (0.50%) per annum on the average daily unused amount of the line of credit, for a maximum of \$25,000 if the line is not utilized.

Cargill pushes Truvia™.

According to Cargill after only two years on the US market, the Truvia™ brand has become the number one stevia-based sweetener, and opened a new category of sweetness. This innovation attracted new consumers to the market and grew a previously stagnant retail sweetener category by 18 percent. As such, it has become the third best-selling of all the non-sugar sweeteners – a market currently valued at \$685 million (£434 million) in the U.S. – overtaking Merisant's Equal® (aspartame) – CandereI® in Europe – for the past 12 months. Latest figures value the UK market for low calorie sweeteners at £50 million.

KEY POINTS

- ❖ There is significant operating leverage in the wheat and other seed processing businesses.
- ❖ Stevia is a very large opportunity with modest entry costs for the company.

OVERVIEW

The company was formed in 1980 to breed, contract to grow, process and sell agricultural commodities, primarily alfalfa seed and, to a lesser extent, wheat. It owns and operates a 40-acre seed cleaning and processing facility in Five Points, California. Seeds are harvested and cleaned from plants grown by farmers in the San Joaquin Valley of California that have worked with S&W Seed for multiple generations. Sale of proprietary alfalfa seed varieties has been a mainstay of the business for decades, but the company has also derived material revenue from processing wheat and other small grains, which should continue to generate revenue in the future.

In fiscal 2010, the company started a pilot program to produce and sell Stevia leaf, the source of an all natural, non-caloric, sweetener.

World Agriculture Overview:

One of the biggest challenges the world faces is to expand agricultural production so that it can meet the food and nutritional demands of the world's growing population. The United Nations Population Division estimates that worldwide population has been consistently gaining more than 79 million people each year since 1999. The United Nations projects that the world population will increase by 35% to 7.7 billion from 1995 to 2020, with 95% of this population increase expected in developing countries.

Improvements in farm productivity have allowed agriculture to keep pace with growing food demand. Yield-enhancing technologies such as mechanization, hybrid seed and crop protection chemicals have enabled farmers to meet the ever-growing demand for food. However, due to decreases in the amount of arable land and shrinking worldwide fresh water resources, further increases in agricultural production must come from improvements in agricultural productivity. Increased use of fertilizer has improved crop yields but overuse can cause problems of increased salt content in the soil.

S&W Seed attacks this problem by breeding high-yielding alfalfa seeds that are tolerant to inferior, saline soils, thereby increasing the productivity of marginal soils with inferior water quality.

Alfalfa Seed Industry:

Alfalfa (*Medicago sativa* L.) is often referred to as the "Queen of Forages" due to its relatively good digestibility, high protein content, and ability to readily fix nitrogen. As a result of fixing nitrogen, the protein produced by alfalfa has a high economic return in dairy systems because minimal outside inputs are required to produce it (i.e., no expensive nitrogen-based fertilizers).

The alfalfa plant is primarily used for animal feed. Seed is planted to produce alfalfa that is then used for grazing, "greenchop" (fresh alfalfa cut in the field without drying), silage, baled hay, cubes or pellets as a primary food stock for the livestock industry, which includes dairy and beef cattle, horses and sheep. Although originally a hot climate plant native to the Middle East, dormant and semi-dormant varieties of alfalfa have adapted to cold climates by going dormant during periods when frost or snow conditions would otherwise kill them. Dormancy is rated using a numerical system under which fully dormant

varieties are rated 2 through 4, and the most non-dormant varieties are rated 10. The non-dormant varieties are best suited to hot, dry climates, where the growing season is able to be sustained for most of the year, resulting in larger yields per plant.

Of the approximately half-million acres under irrigation in Imperial County, California, almost half is seeded to alfalfa. Approximately 80 million pounds of alfalfa seed are produced in the U.S. each year. The Pacific Northwest produces seed of semi-dormant and dormant varieties, while substantially all of the seed produced in California is of non-dormant varieties, with dormancy ratings of between 7 and 10.

The climate in the western U.S. is excellent for production of high-quality alfalfa seed, and 85% of U.S. alfalfa seed is produced in California, Idaho, Oregon, Washington and Nevada. Although California is the largest supplier of alfalfa seed in the U.S., changes in economics, including the cost of water and the economic return to farmers for planting competing crops, as well as environmental and regulatory constraints, including pesticide regulations, have had a negative impact on California production. While expansion in Idaho, Oregon and Washington has maintained total U.S. supplies of alfalfa seed at a near constant level, this production has not replaced California's production of non-dormant varieties because these Northwestern states lack the warm climate suited to non-dormant varieties. A significant percentage of California's production is exported to the Middle East, North Africa, Mexico and other hot, arid regions of the world.

Alfalfa seed production is demanding for even the most experienced farmers. Farming practices must be tailored to the climatic conditions of each area. Irrigation must be carefully controlled and timed to stress the plants to cause maximum flowering and seed production. Weed control is essential in order to pass inspections for purity needed for certification. Insect pests, especially lygus bugs, must be managed throughout the season, using strategies that protect pollinators, such as honey bees, leafcutter bees and alkali bees. Fields are desiccated using chemicals that remove moisture and then are harvested as quickly thereafter as possible to limit or avoid rain damage.

The alfalfa industry (and therefore the alfalfa seed industry) is highly dependent on the dairy industry, which is the largest consumer of alfalfa hay. In recent years, the California dairy industry has been severely impacted by prices being set below production costs. Dairy prices are now improving, albeit slowly.

S&W Seed has developed high-yielding alfalfa seed that is tolerant to inferior, saline soils, thereby allowing farmers to farm marginal soils with inferior water quality as productively as they do superior soils. Alfalfa seed is used for growing animal feed, known as "forage," which is essential for dairy and beef cattle, horses and other livestock. We specialize in developing proprietary alfalfa seed varieties that are suited to warmer climates and produce high yields of superior quality alfalfa hay. Although our non-dormant seed varieties are not well suited to colder environments where freezing conditions are common, because of the highly advantageous characteristics of our varieties for hot climates, approximately 50% of our alfalfa seed is sold to end users in Saudi Arabia, Morocco and countries in Latin America.

The company's "flagship" salt tolerant variety, SW 9720, was rated No. 1 out of 44 top alfalfa varieties as of the end of the 2008 season in yield per acre tests conducted by the University of California at Davis ("UC Davis"). During the fall of 2009, certain growers agreed (under contract) to produce an improved seed variety that is 15% more salt tolerant than SW 9720 while producing equal or better yields. This variety will be available for sale for the first time during the 2010 sales season, which falls

primarily between June and mid-October. Many years are needed to create, test and build a market for seed products. The company has used the past almost 30 years to breed and build awareness of the seed varieties it markets and sells.

This is a barrier to entry because of the long length of time required to develop competitive alfalfa seed varieties without genetic engineering. The company has not employed genetic engineering in the development of seed varieties, which permits it to sell seeds throughout the world. Europe, the Middle East, and certain other parts of the world do not permit the use of genetically modified organism (“GMO”) alfalfa, although As a result the company is investigating what actions would be required when GMO alfalfa varieties became legal.

An All Natural Sweetener

Over the past several years, use of an all natural sweetener made from the Stevia plant has begun to attract significant attention from flavor ingredients and consumer product companies in the U.S. Stevia is a genus of about 240 species of herbs and shrubs in the sunflower family (asteraceae), native to subtropical and tropical regions from western North America to South America. Stevia grows wild as a small shrub in parts of Paraguay and Brazil. The glycosides in its leaves, including up to 10% Stevioside, account for its incredible sweetness, making it unique among the nearly 300 species of Stevia plants. There are indications that Stevia (or Ca-he-he) has been used to sweeten a native beverage called mate since Pre-Columbian times. However, a Natural Scientist names Antonio Bertoni first recorded its usage by native tribes in 1887.

The Stevia plant has been used as a base for sweeteners around the world for hundreds of years, from Native Americans centuries ago, to the Japanese in the early 1900s, to even Russia and China during the Cold War. The majority of Stevia crop around the world today is now found in China, where a very large number of small farmers cultivate the plant. However, as demand is increasing, production is spreading into new areas around the equator such as Paraguay, Kenya, Indonesia, and India.

California may be an ideal environment to grow the plant. Cold weather kills the plant so it is replanted every year in northern climes. In the San Joaquin Valley the cool weather causes the plant to become dormant but it grows back in the spring. This could be a major plus since the costs of the leaf will be lower.

Leaf extracts called steviol glycosides contain a mixture of over two dozen related compounds, including several forms of rebaudiosides, steviosides, and dulcosides, the chemical structures of two rebaudiosides are shown below. Two major compounds found in steviol glycosides, stevioside and rebaudioside A (Reb-A), have a sweetness ranging from 250x to 450x that of sucrose:

Compound Sweetness:

Lactose	0.16x
Erythritol	0.65x
Glucose	0.75x
Sucrose (sugar)	1x
Fructose	1.5x
Aspartame (Equal)	200-250x
Stevioside	200-250x
Reb-B	200-300x
Reb-A (Truvia, PureVia)	300-400x
Saccharin (Sweet N Low)	500x
Sucralose (Splenda)	600x

Not all of the compounds in the Stevia leaf have practical use. Scientists have discovered that rebaudioside A is the least bitter of all the compounds in the Stevia plant, and thus it has the most applicable use for foods and beverages as a low-calorie sweetener. Medical research has also shown Stevia has a negligible effect on blood glucose, thus making it an attractive natural alternative to people on carbohydrate-controlled diets such as type 1 and type 2 diabetics. These extracts may also contain possible benefits in treating obesity and high blood pressure.

Steviol glycosides were first commercialized as a sweetener in 1971 by the Japanese firm, Morita Kagaku Kogyo Co., Ltd., a leading stevia extract producer in Japan. The path to market in the U.S. was not a smooth one however. In 1991 the U.S. FDA labeled stevia as an unsafe food additive and restricted its import. The FDA stated at the time that the "toxicological information on stevia is inadequate to demonstrate its safety." Stevia remained banned until after the 1994 Dietary Supplement Health and Education Act forced the FDA in 1995 to revise its stance and allow stevia to be used as a dietary supplement. This was different from use as a food additive however, and stevia use remained limited until 2006 when the World Health Organization (WHO) performed a thorough evaluation of experimental animal and humans studies of stevioside conducted over the past several decades. The WHO concluded that stevioside and rebaudioside A (Reb-A) are not genotoxic *in-vitro* or *in-vivo* and that the genotoxicity of steviol and some of its oxidative derivatives *in-vitro* is not expressed *in-vivo*." The report also found no evidence of carcinogenic activity. Furthermore, the report noted that "stevioside has shown some evidence of pharmacological effects in patients with hypertension or with type-2 diabetes," but concluded that further study was required to determine proper dosage. This opened the door to the commercialization of broad scale stevia-based sweeteners in the U.S.

Cargill was among the first to move on the WHO report. Rebiana is the trade name for a zero-calorie sweetener containing mainly Reb-A produced by Cargill. In 2007, Cargill, in collaboration with Coca-Cola Co., announced plans to obtain approval for their stevia-derived sweetener using Rebiana and erythritol (a natural sugar alcohol) called Truvia. In December 2008, the U.S. FDA approved Reb-A at purifications greater than 95% for commercial use under the generally recognized as safe (GRAS) designation. Not coincidentally, shortly after, PepsiCo and PureCircle announced PureVia, a similar stevia-based sweetener. Since their approval, stevia-derived sweeteners have gained significant market share in the alternative / natural sweetener market. In fact, both Coke and Pepsi have expanded use of their respective Reb-A products for use in food and beverages. The products perceived safety and all-natural marketing campaign has greatly increased demand for products.

The extraction process uses freshwater brewing, similar to making tea, to unlock the plant's natural components, including rebaudioside, stevioside, and dulcoside. Reb-A is the primary target for commercial use. The crude extract is then refined to isolate out the Reb-A using crystallization and separation technology. Improvements in yield, breeding, and natural selection has allowed manufacturers, including Cargill and PureCircle to dramatically increase Reb-A yields from 15 to 20% for wild Stevia to over 55% for farmed Stevia. According to PureCircle, it takes approximately 40 lbs of Stevia leaf to produce 1 lb of Reb-A. Through leveraging economies of scale and improving crop yields, PureCircle expects to be able to produce 1 lb of Reb-A from only 20 lbs of Stevia leaf in the near future. The balance of co-product, including

Reb-C, is refined out and either recycled or used in the production of other products. Reb-A is a very stable product, with no degradation observed for up to five-year storage at room temperature and 60% relative humidity. The product is highly soluble. Pricing is approaching that of sugar and high-fructose corn syrup.

Soft drinks including sodas, juices, teas, sports drinks, and alcoholic beverages are a \$100+ billion market in the U.S. Add in confectionary products such as canned fruit, ketchup, dairy, cereals, chocolate, and snack bars, the total market opportunity eclipses \$200 billion. Sugar and high-fructose corn syrup (HFCS) are an estimated \$50 billion market worldwide. That being said, artificial and natural low-calorie sweeteners are a small fraction of the entire worldwide sweetener market. By comparison, artificial and natural low-calorie sweeteners are only a \$5.5 billion market. But use is on the rise, especially following the approval of natural products like Stevia and highly successful marketing campaigns for Splenda to the older artificial sweeteners such as Equal, NutraSweet, and Sweet N Low. Over 200 million Americans used alternative low-calorie sweeteners in the U.S. in 2008. Stevia based sweeteners are far more common outside the U.S., mainly in Asia and South America, but gaining popularity quickly inside the U.S. following the FDA's decision in December 2008.

Consumers want a safe low-calorie alternative. J&J's Splenda (sucralose), only approved in 2006, is marketed as made from sugar. Splenda is actually an artificial product, but the advertising campaign has been so successful that the compound now dominates the market. However, the low-hanging fruit for Stevia companies is going after the artificial sweetener market. Market surveys indicate that 45% of Americans have a negative perception of artificial sweeteners such as aspartame and saccharine.

Zacks estimates that the 2016 global Stevia market will be about \$550 million a year, with Asia at a 36% market share, N. America at 30% and S. America at 24%. Japan accounted for roughly half of the market in 2009, consuming about 1300 metric tons, up from the equivalent of 700 metric tons of Stevia leaves in 1987 alone. However, by 2015 the global Stevia market could eclipse 6,000 metric tons worldwide as use in the U.S. increases and regulatory approval in Europe allows for increased use. Stevia-derived sweeteners are growing significantly faster than the artificial sweetener market, our estimate is around 25% annually. About 80% of stevia production and processing is in China.

: Redpoint Bio Corporation report by J. Napodano, Zacks Investment Research, March 2, 2010.

Economics and pricing and price stability will be key determinant in the future growth of Stevia as an alternative sweetener to sugar, HFCS, or artificial sweeteners. Prices vary widely between manufacturers for the same product making the pricing a complex issue. A position paper written in February 2009 by KnowGenix entitled, "Stevia as an alternative sweetener, promise and challenges" concludes that suppliers must rationalize Stevia prices to enter the mainstream ingredient business. Economies of scale and distribution will also throw up new challenges impacting the pricing. Sugar currently (11 July, 2010) costs around \$0.17/lbs, or \$375 per metric ton (2204.6 lbs). However, the price of sugar has increased dramatically over the past three years. We estimate the global beverage giants spend an estimated \$7 billion each year on sugar.

Price of Sugar

Alternative (artificial) sweeteners such as aspartame and saccharin cost \$55,000 and \$25,000 per ton, respectively. Sucralose (Splenda) costs around \$450,000 per tonne. Cost for Reb-A is still high compared to table sugar (sucrose), and still significantly higher than artificial sweeteners aspartame and saccharin. The majority of the cost associated with Reb-A today is raw leaf material sourcing, at approximately 70% to 80% of the total cost. As noted above, PureCircle can produce about 1 lbs of Reb-A from 40 lbs of Stevia leaf. Manufacturers including PureCircle and GLG / Cargill hope to improve this ratio through leveraging economies of scale and improving crop yields. By 2016 we would expect the key suppliers will be able to produce 1 lb of Reb-A from only 20 lbs of Stevia leaf. This would allow for a cost of around \$125,000 per ton. Adjusting the cost per sweetness unit (1 unit = 1x), we see that current Reb-A pricing is above sugar prices. If the price of Reb-A can get down to \$125,000 per ton, it would be extremely attractive for manufacturers like Coca-Cola, PepsiCo, Nestle SA, Dannon, and Corn Products Intl. to begin to use Reb-A in far greater quantities.

S&W Seed has applied for several patents for stevia plants that have significantly higher stevia Reb-A concentrations in the leaves and the plants are more vigorous, thereby increasing the output of leaves per plant. Commercialization of these plants will lower the cost of the Reb-A.

INDUSTRY OUTLOOK

The demand for alfalfa depends on the number of animals that eat forage, mainly cattle for the dairy industry and cattle for meat consumption but also for horses, sheep and goats. Humans also eat alfalfa sprouts in salads and sandwiches. These are fairly stable, but low growth, markets. However, the size of the dairy herd depends on the price and demand for milk and the price of beef has a marked impact on the number of beef cattle. Overall, demand for alfalfa, and for alfalfa seed, should improve in the near term as the economy improves.

INDUSTRY POSITION

Alfalfa is the fourth most widely grown crop in the United States (behind corn, wheat, and soybeans) with an estimated value is over \$8 billion US. There are 24 million acres of alfalfa cut for hay with an average yield of 3.35 tons per acre. The acreage of all hay harvested including alfalfa per year is over 60 million with an estimated value of \$13 billion. When the value of alfalfa as a mixture with other forages is considered the acreage and value of hay is approximately equal to wheat and soybeans in the U.S.

Alfalfa seed is primarily grown in the northwestern areas of the U.S. primarily in the western states of California, Idaho, Nevada, Oregon, Wyoming, and Washington. The approximate yield of alfalfa seed in 1999 for the U.S. was 115 million pounds, with average price of \$190 per 100 pounds of seed, thus the estimated value of alfalfa seed is \$218.5 million dollars. A fringe benefit to the production of alfalfa seed is the production of honey from bees. In the U.S., \$147.7 million dollars worth of honey is produced each year from bees pollinating alfalfa.

S&W Seed is the largest seed producer worldwide in the alfalfa market. However, it is more important as a producer of salt and heat resistant products that are exported to other countries. With the recent acquisition of IV Seeds it may be the largest US company in the export market. The pending purchase of SGI makes the company the worldwide leader in non-dormant alfalfa seed production.

VALUATION

There is no historical valuation that can be used as guidance and there are no direct peers to use as a comparison. Institutional ownership has increased to over 40% since, moving from less than 4% a year ago (Source: Yahoo finance). Increasing institutional demand is a bullish sign. The potential growth rate of EPS exceeds 35%. The acquisition of the alfalfa operations of Pioneer DuPont, S&W Seed's largest distributor in the Middle East and of IV Seeds and SGI in Australia, as well as other acreage, will ultimately enhance profitability. Revenue from dormant varieties could be significant starting in fiscal 2015. Additional sales from the Du Pont Pioneer operations will nearly double the current level of revenue. The introduction of GMO alfalfa and other GM varieties will have a significant impact on gross margins and expand market penetration in those countries that allow GM plants.. We expect some revenue from GMO alfalfa in FY 2017. Both sorghum and sunflower should contribute to revenue in calendar 2017 with significant gains in 2019 fiscal year..

We expect some revenue from stevia in the 2019 fiscal year.

RISKS

Risks relating to the alfalfa, sunflower and sorghum business and Industry:

- **Adverse weather conditions, natural disasters, crop disease, pests and other natural conditions can impose significant costs and losses on the company.**

Alfalfa seed is vulnerable to adverse weather conditions, including windstorms, floods, drought and temperature extremes, which are quite common but difficult to predict. In addition, alfalfa seed is vulnerable to crop disease and to pests, which may vary in severity and effect, depending on the stage of production at the time of infection or infestation, the type of treatment applied and climatic conditions. Unfavorable growing conditions can reduce both crop size and quality. These factors can nevertheless directly impact the company by decreasing the quality and yields of seed, reducing the amount of product for sale, increasing costs and decreasing revenue and gross margins.

- ***Earnings may be sensitive to fluctuations in market prices and demand for alfalfa seeds.***

Growing conditions, particularly weather conditions such as windstorms, floods, droughts and freezes, as well as diseases and pests, are primary factors affecting market prices because of their influence on the supply and quality of product. Recently, the severe downturn in the California dairy industry that resulted from over-supply had a corresponding negative effect on sales of alfalfa hay and therefore alfalfa seed.

- ***Because the seed business is highly seasonal, revenue, cash flows from operations and operating results will fluctuate on a seasonal and quarterly basis.***

The seasonal nature of operations results in significant fluctuations in working capital during the growing and selling cycles. As a result, operating activities during the first and second fiscal quarters use significant amounts of cash, and in contrast, operating activities for the fourth and first fiscal quarters generate substantial cash as inventory is shipped and collect accounts receivable.

- ***The company depends on a core group of significant customers, financial and operating results of operations will be negatively affected if key customers reduce the amount of products they purchase.***

In 2009 the top three customers together accounted for approximately 61% of net sales in fiscal 2009, with the largest customer accounted for approximately 43% of net sales. After several significant acquisitions the US accounted for 18% of sales, Saudi Arabia 26% and Libya and Australia were each 10% in the four quarters ending in Sept. 2014. With the acquisition of the alfalfa operations on Pioneer DuPont this will change significantly.

Operating results are significantly impacted not only by the quantity of seed purchased by these customers, but also by the timing of their purchases, a factor over which S&W Seed does not have any control. Timing of purchases, particularly by customers for sale in Saudi Arabia, has in the past impacted the financial results.

- ***No long term contracts***

There are no long-term contracts with any of the customers, and they may not continue to purchase products. The loss of, or a significant adverse change in, the company's relationship with these customers, or any other major customer, could have a material adverse effect on business, financial position, results of operations and operating cash flows. The loss of, or a reduction in orders from any

significant customer, losses arising from customers' disputes regarding shipments, product quality, or related matters, or an inability to collect accounts receivable from any major customer could have a material adverse effect. In addition, revenue from customers that have accounted for significant revenue in past periods, individually or as a group, may not continue, or if continued, may not reach or exceed historical levels in any period.

- ***Because the company does not grow all of the alfalfa seed that it sells, it is entirely dependent on its network of growers, and sales, cash flows from operations and results of operations may be negatively affected if any of the largest growers were to stop supplying seed.***

The company has a relatively small network of growers of alfalfa seed that together provide all of the seed sold to customers. Of these growers, one grower accounted for approximately 37% of planted acreage and over 13% of the total amount of seed purchased from our growers in fiscal 2009. Three growers accounted for approximately 44% of total seed purchases from growers in fiscal 2009.

- ***A lack of availability of water in California's San Joaquin Valley and Central Valley could impact business.***

Adequate quantities and correct timing of the application of water are vital for most agriculture to thrive. 2010 will be the fourth consecutive year of drought conditions in California, causing below normal snowpack, river runoff and reservoir levels. Federal allocations of water to farmers have been severely cut back during the drought years and are expected to continue in the future. These conditions have caused some farmers to revise their crop plans to plant less water-intensive crops or, in the most severe cases, to lose their farms. Whether particular farms are experiencing water shortages depends, in large part, on their location, although continuing drought conditions could threaten all farmland other than those properties with their own water sources. Although alfalfa seed is not a water-intensive crop, the availability or the cost of water is a factor in the planting of the alfalfa hay. If the dairy farmers and others who purchase alfalfa seed to grow hay cannot get an adequate supply of water, or if the cost of water makes it uneconomical for the farmers to grow alfalfa, they may not buy alfalfa seed.

- ***Roundup Ready alfalfa will be available for sale in 2015 or soon thereafter, and its availability could impact existing product sales.***

In a 7-1 ruling on June 21, 2010, the U.S. Supreme Court overturned a lower court's order that has prohibited farmers from planting Roundup Ready alfalfa for the past three years. However, there has been considerable discussion by lawmakers about the risks to the dairy industry and the organic food industry if Roundup Ready alfalfa is cleared for commercial use. Roundup Ready alfalfa successfully completed a food safety review by the Food and Drug Administration (FDA) and was granted non-regulated status by USDA in 2005. A separate review by the Environmental Protection Agency (EPA) found the use of Roundup on the crop to be safe. Prior to the injunction, Roundup Ready alfalfa was planted by approximately 5,500 growers across more than 220,000 acres. Alfalfa is the fourth-largest crop grown in the U.S. with 23 million acres grown in 48 U.S. states annually.

INSIDER TRADING AND OWNERSHIP

Over the last 6 months insider transaction was a net purchase of 5,519 shares.

HISTORICAL STOCK PRICE

DISCLOSURES

The following disclosures relate to relationships between Zacks Small-Cap Research ("Zacks SCR"), a division of Zacks Investment Research ("ZIR"), and the issuers covered by the Zacks SCR Analysts in the Small-Cap Universe.

ANALYST DISCLOSURES

I, Ian Gilson, hereby certify that the view expressed in this research report accurately reflect my personal views about the subject securities and issuers. I also certify that no part of my compensation was, is, or will be, directly or indirectly, related to the recommendations or views expressed in this research report. I believe the information used for the creation of this report has been obtained from sources I considered to be reliable, but I can neither guarantee nor represent the completeness or accuracy of the information herewith. Such information and the opinions expressed are subject to change without notice.

INVESTMENT BANKING AND FEES FOR SERVICES

Zacks SCR does not provide investment banking services nor has it received compensation for investment banking services from the issuers of the securities covered in this report or article.

Zacks SCR has received compensation from the issuer directly or from an investor relations consulting firm engaged by the issuer for providing non-investment banking services to this issuer and expects to receive additional compensation for such non-investment banking services provided to this issuer. The non-investment banking services provided to the issuer includes the preparation of this report, investor relations services, investment software, financial database analysis, organization of non-deal road shows, and attendance fees for conferences sponsored or co-sponsored by Zacks SCR. The fees for these services vary on a per-client basis and are subject to the number and types of services contracted. Fees typically range between ten thousand and fifty thousand dollars per annum. Details of fees paid by this issuer are available upon request.

POLICY DISCLOSURES

This report provides an objective valuation of the issuer today and expected valuations of the issuer at various future dates based on applying standard investment valuation methodologies to the revenue and EPS forecasts made by the SCR Analyst of the issuer's business.

SCR Analysts are restricted from holding or trading securities in the issuers that they cover. ZIR and Zacks SCR do not make a market in any security followed by SCR nor do they act as dealers in these securities. Each Zacks SCR Analyst has full discretion over the valuation of the issuer included in this report based on his or her own due diligence. SCR Analysts are paid based on the number of companies they cover. SCR Analyst compensation is not, was not, nor will be, directly or indirectly, related to the specific valuations or views expressed in any report or article.

ADDITIONAL INFORMATION

Additional information is available upon request. Zacks SCR reports and articles are based on data obtained from sources that it believes to be reliable, but are not guaranteed to be accurate nor do they purport to be complete. Because of individual financial or investment objectives and/or financial circumstances, this report or article should not be construed as advice designed to meet the particular investment needs of any investor. Investing involves risk. Any opinions expressed by Zacks SCR Analysts are subject to change without notice. Reports or articles or tweets are not to be construed as an offer or solicitation of an offer to buy or sell the securities herein mentioned.
